Strategy Settings Optimization – Executive Summary

- ****Ichimoku Parameters Adjustments:****
 - ****Tenkan Period:**** Decrease from 9 to 7 for improved responsiveness to price changes.
 - ****Kijun Period:**** Reduce from 26 to 20 to enhance entry and exit timing.
 - ****Senkou B Period:**** Slightly decrease from 52 to 48 for better alignment with price action.
 - ****Chikou Offset:**** Reduce from 26 to 20 to provide earlier signals.
 - ****Senkou Offset:**** Decrease from 26 to 20 to improve predictive capability.
- ****Signal Logic:****
 - Maintain current buy and sell logic to ensure strict confirmation for entries and exits.
 - ****Add Condition:**** Introduce "ChikouAbovePrice" to enhance buy signal confirmation.
- ****Risk Management Enhancements:****
 - Tighten stop loss from 3% to 2% to minimize adverse impacts.
 - Implement a take profit level at 5% to lock in gains effectively.
 - Transition from fixed to volatility-based position sizing to optimize risk exposure.
- ****Proposed Experiments:****
 - ****Walk-forward grid:**** Optimize Ichimoku parameters under varying market conditions.
 - ****Trend filter A/B:**** Assess the impact of additional conditions on overall trade performance.

Recommended setting changes:

- `tenkan_period`: current=9, suggested=7. Reducing the `tenkan` period may increase responsiveness to price changes, potentially capturing more short-term trends.
- `kijun_period`: current=26, suggested=20. A shorter `kijun` period can enhance the strategy's ability to react to market movements, improving entry and exit timing.
- `senkou_b_period`: current=52, suggested=48. Slightly decreasing the `senkou B` period may help in better aligning the cloud with current price action.
- `chikou_offset`: current=26, suggested=20. Reducing the `chikou` offset can provide earlier signals by aligning the lagging line closer to current price.
- `senkou_offset`: current=26, suggested=20. A shorter `senkou` offset can enhance the cloud's predictive capability, aligning it more closely with current trends.
- Signal logic:
 - `buy_logic`: AND -> AND (Maintaining the current logic ensures strict confirmation for entries, which is crucial for risk management.)
 - `sell_logic`: AND -> AND (Keeping the sell logic as is preserves the strategy's discipline in exiting trades.)
 - `add_conditions`: ['ChikouAbovePrice']
- Risk management:
 - `stop_loss_pct`: 3.0 -> 2.0 (Tightening the stop loss can reduce the impact of adverse moves and improve overall risk management.)
 - `take_profit_pct`: None -> 5.0 (Implementing a take profit level can help lock in gains and improve the win rate.)
 - `position_sizing`: fixed -> volatility (Switching to a volatility-based position sizing can optimize risk exposure relative to market conditions.)

Experiments to run:

- Walk-forward grid: Optimize Ichimoku parameters across different market conditions.
- Trend filter A/B: Test the impact of additional conditions on trade performance.
